1 General

This documents introduces WECON V-BOX HTTP API. And this document also shows some examples. All example is tested from postman application.

Server address: http://api.v-box.net/box-data/api/{acturl}
Transport protocol: HTTP protocol

1.1 Interface parameter description

Global parameters

The following acturls need to have global parameters (The global parameter client is put into the JSON format and placed in the common parameters of the Headers)

Parameters	Description
sid	sessionId session ID (Obtained after login, and is used for all acturls after login)
comid	Company ID (Obtained from WECON, and is used for all acturls)
compvtkey	Company private key (Obtained from WECON, and is used for all acturls)
ts	Timestamp (UTC time: 1970-1-1 00:00:00 to the current client time in seconds)
sign	How to get sign **Step 1:** Format the request parameter as *key=value* (Including parameters of acturl and parameters parsed by commons of Headers). Such as *k1=v1*, *k2=v2*, *k3=v3*; **Step 2:** The "key=value" formatted in the first step is sorted in ascending order of the first letter of the key name, and then joined together. Such as *k1=v1&k2=v2&k3=v3* (Null value, no need to splicing); **Step 3:** Add *screctkey*, at the end of step 2. Such as *&key=f1cd9351930d4e589922edbcf3b09a7c* The MD5 value of step 3 string is sign **Note:** The value of each key is calculated without the actual value of urlencode

The returned result represented by Json and case sensitive:

1) Abnormal

{"code" : 403, "msg" : "SessionID (user session ID) invalid", "reqId": "1502074141465"}

2) Normal

{"code" : 200 , "result": {}, "msg" : "ok", "reqId":"1502074141465"}

State code description

Codes	Description
200	Success
403	SessionID (User session ID) invalid
400	Illegal parameter value
503	Unknown server error

1.2 Example key and value

1) **comid**=2
2) **comkey**=589625dce895454dbff9782c299db156
3) **screctkey**=f1cd9351930d4e589922edbcf3b09a7c
